

# Lab 8: SLAM Visualisation

**MCHA4400** 

Semester 2 2025

# Introduction

In this lab, you will develop a visualisation of the marginal distributions of camera and landmark positions that will serve as a foundation for the landmark SLAM rendering aspects of Assignment 1.

# GenAI Tip

You are strongly encouraged to explore the use of Large Language Models (LLMs), such as GPT, Gemini or Claude, to assist in completing this activity. If you do not already have access to an LLM, bots are available to use via the UoN Mechatronics Slack team, which you can find a link to from Canvas. If you are are unsure how to make the best use of these tools, or are not getting good results, please ask your lab demonstrator for advice.

Before beginning this lab, merge your earlier work into the Lab 8 template as follows:

- Merge src/GaussianBase.hpp from Lab 6 or Lab 7.
- Merge src/GaussianInfo.hpp from Lab 7.
- Merge the following in src/Camera.cpp from Lab 4:

- Camera::calibrate

- Camera::vectorToPixel

- Camera::worldToVector

— Camera::pixelToVector

— Camera::isVectorWithinFOV

— Camera::calcFieldOfView

- ChessboardData::ChessboardData

- ChessboardImage::ChessboardImage

- ChessboardImage::drawBox

# $^{ m N}$ Note

The Pose class has been re-implemented in src/Pose.hpp as a template class using Eigen (instead of OpenCV) with the scalar type templated to enable automatic differentiation through kinematic expressions. If you previously used Pose in your Lab 4 solution, some instances of Pose may need to be replaced with Pose<double>.

Be mindful that some other changes have been made to these classes, so double check before overwriting any code (use your favourite merge tool).

# 1. Rotations

In this task you will create templated rotation functions, within src/rotation.hpp, to transform between a rotation matrix and its RPY Euler angle parameterisation.

Refer to the Week 4 slides on parameterisations of SO(3).

### **Tasks**

- a) Remove the doctest::skip decorator from each SCENARIO in test/src/rotation.cpp to enable these unit tests and run ninja to verify that they *fail* due to the incomplete implementations provided.
- b) Complete the templated function rotx, which returns  $\mathbf{R}_x(\phi)$ .
- c) Complete the templated function roty, which returns  $\mathbf{R}_y(\theta)$ .
- d) Complete the templated function rotz, which returns  $\mathbf{R}_z(\psi)$ .
- e) Complete the templated function rpy2rot, which returns  $\mathbf{R}(\mathbf{\Theta}) = \mathbf{R}_z(\psi)\mathbf{R}_y(\theta)\mathbf{R}_x(\phi)$  from the vector of Euler angles  $\mathbf{\Theta} = \begin{bmatrix} \phi & \theta & \psi \end{bmatrix}^\mathsf{T}$ .
- f) Complete the templated function rot2rpy, which returns a vector of Euler angles  $\boldsymbol{\Theta} = \begin{bmatrix} \phi & \theta & \psi \end{bmatrix}^\mathsf{T}$  for the given  $\mathbf{R} \in \mathsf{SO}(3)$ .
- g) Build the application and ensure the unit tests in test/src/rotation.cpp pass.

# 2. Landmarks to features

The world-to-pixel model we developed in Lab 4 maps the location of the world point  $\mathbf{r}_{P/N}^n$  to its location in the image  $\mathbf{r}_{Q/O}^i$ . This was previously implemented with the help of  $\mathsf{cv::projectPoints}$ ; however, now we will need to compute the derivatives of this function with respect to the state variables in a SLAM solution.

We will consider the same rational radial distortion, decentering distortion and thin prism distortion models supported by OpenCV, and let  $\theta_{\text{dist}} \in \mathbb{R}^m$  be the distortion coefficients of the planar camera model,

$$\begin{bmatrix} u' \\ v' \end{bmatrix} = \underbrace{c \begin{bmatrix} u \\ v \end{bmatrix}}_{\text{radial distortion}} + \underbrace{\begin{bmatrix} 2p_1uv + p_2(r^2 + 2u^2) \\ p_1(r^2 + 2v^2) + 2p_2uv \end{bmatrix}}_{\text{decentering distortion}} + \underbrace{\begin{bmatrix} s_1r^2 + s_2r^4 \\ s_3r^2 + s_4r^4 \end{bmatrix}}_{\text{thin prism distortion}}, \tag{1}$$

where

$$r^2 = u^2 + v^2,$$
  $u = \frac{x}{z},$   $v = \frac{y}{z},$   $\mathbf{r}_{P/C}^c = \begin{bmatrix} x \\ y \\ z \end{bmatrix}.$  (2)

The radial distortion coefficient is given by the following rational model:

$$c = \frac{1+\alpha}{1+\beta},\tag{3}$$

where

$$\alpha = k_1 r^2 + k_2 r^4 + k_3 r^6, \tag{4}$$

$$\beta = k_4 r^2 + k_5 r^4 + k_6 r^6. \tag{5}$$

Using the above expressions, the mapping from world points with respect to C in camera in the camera basis  $\{c\}$  by

$$\mathbf{r}_{Q/O}^{i} = v2p(\mathbf{r}_{P/C}^{c}; \boldsymbol{\theta}) = \begin{bmatrix} f_{x}u' + c_{x} \\ f_{y}v' + c_{y} \end{bmatrix}, \tag{6}$$

where  $\theta = \{\theta_{\text{cam}}, \theta_{\text{dist}}\}^1$  are the camera intrinsic parameters and  $\theta_{\text{cam}} = \{f_x, f_y, c_x, c_y\}$  are the nontrivial elements of the camera matrix

$$\mathbf{K} = \begin{bmatrix} f_x & 0 & c_x \\ 0 & f_y & c_y \\ 0 & 0 & 1 \end{bmatrix} . \tag{7}$$

The world-to-pixel mapping is defined by composing a kinematic transformation from the world point  $\mathbf{r}_{P/N}^n$  to the camera vector  $\mathbf{r}_{P/C}^c$  with the vector to pixel mapping, which yields

$$\mathbf{r}_{Q/O}^{i} = v2p(\mathbf{r}_{P/C}^{c}; \boldsymbol{\theta})$$

$$= v2p((\mathbf{R}_{c}^{n})^{\mathsf{T}}(\mathbf{r}_{P/N}^{n} - \mathbf{r}_{C/N}^{n}); \boldsymbol{\theta})$$

$$= v2p((\mathbf{R}_{c}^{b})^{\mathsf{T}}((\mathbf{R}_{b}^{n})^{\mathsf{T}}(\mathbf{r}_{P/N}^{n} - \mathbf{r}_{B/N}^{n}) - \mathbf{r}_{C/B}^{b}); \boldsymbol{\theta})$$

$$= w2p(\mathbf{r}_{P/N}^{n}; \mathbf{T}_{b}^{n}, \boldsymbol{\theta}), \tag{8b}$$

where camera position  $\mathbf{r}_{C/N}^n \in \mathbb{R}^3$  and camera orientation  $\mathbf{R}_c^n \in \mathsf{SO}(3)$  determine the camera pose  $\mathbf{T}_c^n \in \mathsf{SE}(3)$  and body position  $\mathbf{r}_{B/N}^n \in \mathbb{R}^3$  and body orientation  $\mathbf{R}_b^n \in \mathsf{SO}(3)$  determine the body pose  $\mathbf{T}_b^n \in \mathsf{SE}(3)$ .

For SLAM using point landmarks, we can consider the following state vector:

$$\mathbf{x} = \begin{bmatrix} \boldsymbol{\nu} \\ \boldsymbol{\eta} \\ \mathbf{r}_{1/N}^n \\ \mathbf{r}_{2/N}^n \\ \vdots \\ \mathbf{r}_{n_L/N}^n \end{bmatrix}, \tag{9}$$

where

$$\nu = \begin{bmatrix} \mathbf{v}_{B/N}^b \\ \boldsymbol{\omega}_{\mathcal{B}/\mathcal{N}}^b \end{bmatrix},\tag{10}$$

$$\boldsymbol{\eta} = \begin{bmatrix} \mathbf{r}_{B/N}^n \\ \mathbf{\Theta}_b^n \end{bmatrix}, \tag{11}$$

<sup>&</sup>lt;sup>1</sup>See the source code for cvProjectPoints2Internal for more details.

are the body-fixed velocities and world-fixed pose, respectively,  $\mathbf{r}_{j/N}^n$  is the position of the  $j^{\text{th}}$  landmark and  $n_L$  is the number of landmarks in the map. The body orientation is parameterised by RPY Euler angles,  $\boldsymbol{\Theta}_b^n = \begin{bmatrix} \phi & \theta & \psi \end{bmatrix}^\mathsf{T}$  such that

$$\mathbf{R}_b^n = \mathbf{R}_z(\psi)\mathbf{R}_y(\theta)\mathbf{R}_x(\phi) = e^{\psi \mathbf{S}(\mathbf{e}_3)}e^{\theta \mathbf{S}(\mathbf{e}_2)}e^{\phi \mathbf{S}(\mathbf{e}_1)}.$$
 (12)

Let  $\mathbf{h}_j(\mathbf{x}) \in \mathbb{R}^2$  denote the pixel coordinates of the feature corresponding to the  $j^{\text{th}}$  landmark as a function of the state  $\mathbf{x}$ , i.e.,

$$\mathbf{h}_{j}(\mathbf{x}) = \mathtt{w2p}(\mathbf{r}_{j/N}^{n}; \mathbf{T}_{b}^{n}, \boldsymbol{\theta}). \tag{13}$$

To propagate the uncertainties in the landmark position and camera pose through to uncertainty in the predicted feature location in an image using an affine transform, we will need to compute the Jacobian of  $\mathbf{h}_i(\mathbf{x})$  with respect to  $\mathbf{x}$ . This has the following block structure:

$$\frac{\partial \mathbf{h}_{j}}{\partial \mathbf{x}} = \begin{bmatrix} \mathbf{0}_{2\times3} & \mathbf{0}_{2\times3} & \frac{\partial \mathbf{h}_{j}}{\partial \mathbf{r}_{B/N}^{n}} & \frac{\partial \mathbf{h}_{j}}{\partial \mathbf{\Theta}_{b}^{n}} & \mathbf{0}_{2\times3} & \cdots & \frac{\partial \mathbf{h}_{j}}{\partial \mathbf{r}_{j/N}^{n}} & \cdots & \mathbf{0}_{2\times3} \end{bmatrix} \in \mathbb{R}^{2\times(12+3n_{L})}.$$
 (14)

Expressions for the analytical derivatives of the non-zero blocks can be found in Appendix B.

### **Tasks**

a) Complete the implementation of the MeasurementSLAMPointBundle::predictFeature template member function in src/MeasurementSLAMPointBundle.h and the member function in src/MeasurementSLAMPointBundle.cpp.

# nfo Info

MeasurementSLAMPointBundle::predictFeature is used within
MeasurementSLAMPointBundle::predictFeatureDensity, which uses
GaussianInfo::affineTransform to propagate the state distribution through the world to pixel map.

These two functions implement  $\mathbf{h}_{j}(\mathbf{x})$  as the return value and the latter function also writes the Jacobian to J, which can be evaluated by one of the following methods:

# i) Analytical derivatives only:

Implement the function

Eigen::Vector2d Camera::vectorToPixel(const Eigen::Vector3d & rPCc, Eigen::Matrix23d
& J) const

within  $\operatorname{src/Camera.cpp}$  that returns  $\mathbf{r}^i_{Q/O}$  and computes  $\mathbf{J} = \frac{\partial \mathbf{r}^i_{Q/O}}{\partial \mathbf{r}^c_{P/C}}$  using the expressions for the analytical Jacobian given in Appendix A. Call this function within MeasurementSLAMPointBundle::predictFeature to obtain  $\frac{\partial \mathbf{h}_j}{\partial \mathbf{r}^n_{j/N}}$  and then assemble the

blocks of the Jacobian  $\frac{\partial \mathbf{h}_j}{\partial \mathbf{x}}$  using the results given in Appendix B.

# ii) Mixed analytical derivatives and automatic differentiation:

Implement the Camera::vectorToPixel template member function within src/Camera.h that returns  $\mathbf{r}^i_{Q/O}$ , ensuring that all scalar values involved in the derivative are of type given by the template parameter Scalar. Then, compute the Jacobian using automatic differentiation

within MeasurementSLAMPointBundle::predictFeature to obtain  $\frac{\partial \mathbf{h}_j}{\partial \mathbf{r}_{j/N}^n}$  and then assemble the blocks of the Jacobian  $\frac{\partial \mathbf{h}_j}{\partial \mathbf{x}}$  using the results given in Appendix B.

# iii) Automatic differentiation only:

Implement the Camera::vectorToPixel template member function within within src/Camera.h that returns  $\mathbf{r}_{Q/O}^i$ , ensuring that all scalar values involved in the derivative are of type given by the template parameter Scalar. Then, implement the MeasurementSLAMPointBundle::predictFeature template member function in src/MeasurementSLAMPointBundle.h that implements  $\mathbf{h}_j(\mathbf{x})$ , ensuring that all scalar values involved in the derivative are of type given by the template parameter Scalar. Finally, in the MeasurementSLAMPointBundle::predictFeature member function in src/MeasurementSLAMPointBundle.cpp, compute the Jacobian of the template function above using automatic differentation, directly yielding  $\frac{\partial \mathbf{h}_j}{\partial \mathbf{x}}$ .

The forward-mode function gradient requires a *callable* type as its first argument, i.e., almost anything that can be called like a function using (). This includes functions, functors, lambda expressions, function pointers and member function pointers, but not member functions themselves. To compute forward-mode gradients on a member function, we could wrap it in a lambda expression, or use std::bind or use a member function pointer. As an example of the latter, if the class C has a template member function called f<>(...) that we want to compute the gradient w.r.t. its first argument, then we can do the following:

Note that the keyword this appears as the first argument in at() because under the hood, the member function call obj.f(x) is implemented similarly to a non-member function call f(obj, x).

# - Tip

The reverse-mode function gradient requires an autodiff::var variable that contains the expression tree built from a forward pass through the function. For example, if the class C has a template member function called f<>(...) that we want to compute the gradient w.r.t. its first argument, then we can do the following:

```
double C::f_grad_rev(const Eigen::VectorXd & x, Eigen::VectorXd & g) const
{
    Eigen::VectorX<autodiff::var> xvar = x.cast<autodiff::var>();
    autodiff::var fvar = f(xvar);  // Build expression tree
    g = gradient(fvar, xvar);  // Evaluate derivatives from tree
```

```
return val(fvar); // cast return value to double
}
```

To compute a Jacobian matrix using forward-mode autodifferentiation, see the jacobian function.

# Tip To compute a Jacobian matrix using reverse-mode autodifferentiation, we can compute each row of the Jacobian using the gradient function as follows, since autodiff doesn't provide a convenient reverse-mode Jacobian: Eigen::VectorXd C::f\_jac\_rev(const Eigen::VectorXd & x, Eigen::MatrixXd & J) const { Eigen::VectorX<autodiff::var> xvar = x.cast<autodiff::var>(); Eigen::VectorX<autodiff::var> fvar = f(xvar); // Build expression tree J.resize(fvar.size(), xvar.size()); for (Eigen::Index i = 0; i < fvar.size(); ++i) J.row(i) = gradient(fvar(i), xvar); // Evaluate derivatives from tree return fvar.cast<double>(); // cast return value to double }

- b) Run ninja and ensure the code builds (especially for those using automatic differentiation). Note that there are no unit tests to validate your solution.
- c) (Optional) If you have implemented any of the analytical Jacobians and wish to check your work, consider writing unit tests that use automatic differentiation to generate the oracle data.

# 3. Confidence regions

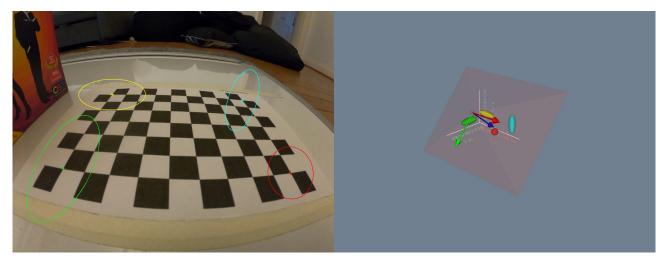

Figure 1: Rendering output for confidence regions of features (left) and camera and landmark positions (right).

### **Tasks**

a) Within src/Plot.cpp, complete the implementation of the QuadricPlot::update function, which calls GaussianInfo::quadricSurface to obtain Q and then populates the coefficients of the vtkQuadric instance via quadric->SetCoefficients(a0, a1, a2, a3, a4, a5, a6, a7, a8, a9).

The vtkQuadric class expects a quadric in the following form

$$F(x, y, z) = a_0x^2 + a_1y^2 + a_2z^2 + a_3xy + a_4yz + a_5xz + a_6x + a_7y + a_8z + a_9 = 0,$$

which can be represented in matrix form as

$$F(x,y,z) = \begin{bmatrix} x & y & z & 1 \end{bmatrix} \underbrace{\begin{bmatrix} a_0 & \frac{1}{2}a_3 & \frac{1}{2}a_5 & \frac{1}{2}a_6 \\ \cdot & a_1 & \frac{1}{2}a_4 & \frac{1}{2}a_7 \\ \cdot & \cdot & a_2 & \frac{1}{2}a_8 \\ \cdot & \cdot & \cdot & a_9 \end{bmatrix}}_{\mathbf{Q}} \begin{bmatrix} x \\ y \\ z \\ 1 \end{bmatrix},$$

where  $\mathbf{Q}$  is a symmetric matrix.

- b) Copy config.xml, camera.xml and all the image files within lab4/data/images to lab8/data.
- c) Run the application and ensure the confidence ellipses and quadric surfaces match those in Figure 1.

## Terminal

nerd@basement:~/MCHA4400/lab8/build\$ ninja && ./lab8 ../data/config.xml [Interactive VTK window is displayed]

The 3D view can be manipulated by dragging the mouse or using the mouse scroll. Try also holding down Ctrl or Shift while dragging the mouse. The mouse interactions are documented in the detailed description section of the vtkInteractorStyleTrackballCamera class and the keyboard commands are documented in the detailed description section of the vtkInteractorStyle class.

d) Export all of the calibration images without blocking on the interactor as follows:

## Terminal

nerd@basement:~/MCHA4400/lab8/build\$ ninja && ./lab8 ../data/config.xml -e -i=0

Inspect the files written to the out directory.

# -`**ૄ**´-Tip

You may need to modify the plotting code for the Assignment(s). Make use of the VTK C++ examples to familiarise yourself with the approach for plotting with VTK. You should familiarise yourself with the following class definitions and documentation to strengthen your rendering knowledge.

- vtkActor represents an object rendered in the scene, including its properties (colour, shading type, etc.) and position in the worlds coordinate system.
- vtkCamera defines the view position, focal point and other viewing properties of the scene
- vtkImageMapper provides 2D image display support for VTK.
- vtkInteractorStyle the controller for window interactivity.
- vtkMapper the geometric representation for an actor. More than one actor may refer to the same mapper.
- vtkProperty defines the appearance properties of an actor including colour, transparency, and lighting properties such as specular and diffuse. Also representational properties like wireframe and solid surface.
- vtkRenderer coordinates the rendering process involving lights, cameras, and actors.
- vtkRenderWindow manages a window on the display device; one or more renderers draw into an instance of vtkRenderWindow.

# A. Jacobian of vectorToPixel

The gradients of u and v with respect to the input  $\mathbf{r}_{P/C}^c$  are given by

$$\frac{\partial u}{\partial \mathbf{r}_{P/C}^c} = \begin{bmatrix} \frac{1}{z} & 0 & -\frac{x}{z^2} \end{bmatrix},\tag{15}$$

$$\frac{\partial v}{\partial \mathbf{r}_{P/C}^c} = \begin{bmatrix} 0 & \frac{1}{z} & -\frac{y}{z^2} \end{bmatrix}. \tag{16}$$

The gradients of the radius with respect to u and v are given by

$$\frac{\partial r}{\partial u} = \left(u^2 + v^2\right)^{-\frac{1}{2}} u,\tag{17}$$

$$\frac{\partial r}{\partial v} = \left(u^2 + v^2\right)^{-\frac{1}{2}} v. \tag{18}$$

The gradient of the radial distortion model with respect to r is given by

$$\frac{\partial \alpha}{\partial r} = 2k_1r + 4k_2r^3 + 6k_3r^5. \tag{19}$$

The gradient of the rational distortion model with respect to r is given by

$$\frac{\partial \beta}{\partial r} = 2k_4r + 4k_5r^3 + 6k_6r^5. {20}$$

The gradient of the c with respect to r is given by

$$\frac{\partial c}{\partial r} = \frac{\frac{\partial \alpha}{\partial r} (1+\beta) - (1+\alpha) \frac{\partial \beta}{\partial r}}{(1+\beta)^2}.$$
 (21)

The gradient of u' with respect to u is given by

$$\frac{\partial u'}{\partial u} = \frac{\partial c}{\partial r} \frac{\partial r}{\partial u} u + c + 2p_1 v + p_2 \left( 2r \frac{\partial r}{\partial u} + 4u \right) + 2s_1 r \frac{\partial r}{\partial u} + 4s_2 r^3 \frac{\partial r}{\partial u}. \tag{22}$$

The gradient of u' with respect to v is given by

$$\frac{\partial u'}{\partial v} = \frac{\partial c}{\partial r} \frac{\partial r}{\partial v} u + 2p_1 u + p_2 \left( 2r \frac{\partial r}{\partial v} \right) + 2s_1 r \frac{\partial r}{\partial v} + 4s_2 r^3 \frac{\partial r}{\partial v}. \tag{23}$$

The gradient of v' with respect to u is given by

$$\frac{\partial v'}{\partial u} = \frac{\partial c}{\partial r} \frac{\partial r}{\partial u} v + 2p_2 v + p_1 \left( 2r \frac{\partial r}{\partial u} \right) + 2s_3 r \frac{\partial r}{\partial u} + 4s_4 r^3 \frac{\partial r}{\partial u}. \tag{24}$$

The gradient of v' with respect to v is given by

$$\frac{\partial v'}{\partial v} = \frac{\partial c}{\partial r} \frac{\partial r}{\partial v} v + c + 2p_2 u + p_1 \left( 2r \frac{\partial r}{\partial v} + 4v \right) + 2s_3 r \frac{\partial r}{\partial v} + 4s_4 r^3 \frac{\partial r}{\partial v}. \tag{25}$$

The Jacobian of (6) with respect to  $\mathbf{r}_{P/C}^c$  is given by

$$\frac{\partial \mathbf{r}_{Q/O}^{i}}{\partial \mathbf{r}_{P/C}^{c}} = \begin{bmatrix} f_{x} \left( \frac{\partial u'}{\partial u} \frac{\partial u}{\partial \mathbf{r}_{P/C}^{c}} + \frac{\partial u'}{\partial v} \frac{\partial v}{\partial \mathbf{r}_{P/C}^{c}} \right) \\ f_{y} \left( \frac{\partial v'}{\partial u} \frac{\partial u}{\partial \mathbf{r}_{P/C}^{c}} + \frac{\partial v'}{\partial v} \frac{\partial v}{\partial \mathbf{r}_{P/C}^{c}} \right) \end{bmatrix}.$$
(26)

# B. Jacobian of worldToPixel

Applying the chain rule to (8a) yields the Jacobians of w2p with respect to  $\mathbf{r}_{P/N}^n$ ,  $\mathbf{r}_{B/N}^n$  and  $\mathbf{\Theta}_b^n$  as follows:

$$\frac{\partial \mathbf{r}_{Q/O}^{i}}{\partial \mathbf{r}_{P/N}^{n}} = \frac{\partial \mathbf{r}_{Q/O}^{i}}{\partial \mathbf{r}_{P/C}^{c}} \frac{\partial \mathbf{r}_{P/C}^{c}}{\partial \mathbf{r}_{P/N}^{n}} = \frac{\partial \mathbf{r}_{Q/O}^{i}}{\partial \mathbf{r}_{P/C}^{c}} (\mathbf{R}_{c}^{b})^{\mathsf{T}} (\mathbf{R}_{b}^{n})^{\mathsf{T}}, \tag{27a}$$

$$\frac{\partial \mathbf{r}_{Q/O}^{i}}{\partial \mathbf{r}_{P/N}^{n}} = \frac{\partial \mathbf{r}_{Q/O}^{i}}{\partial \mathbf{r}_{P/C}^{c}} \frac{\partial \mathbf{r}_{P/C}^{c}}{\partial \mathbf{r}_{P/N}^{n}} = \frac{\partial \mathbf{r}_{Q/O}^{i}}{\partial \mathbf{r}_{P/C}^{c}} (\mathbf{R}_{c}^{b})^{\mathsf{T}} (\mathbf{R}_{b}^{n})^{\mathsf{T}},$$

$$\frac{\partial \mathbf{r}_{Q/O}^{i}}{\partial \mathbf{r}_{B/N}^{n}} = \frac{\partial \mathbf{r}_{Q/O}^{i}}{\partial \mathbf{r}_{P/C}^{c}} \frac{\partial \mathbf{r}_{P/C}^{c}}{\partial \mathbf{r}_{B/N}^{n}} = -\frac{\partial \mathbf{r}_{Q/O}^{i}}{\partial \mathbf{r}_{P/C}^{c}} (\mathbf{R}_{c}^{b})^{\mathsf{T}} (\mathbf{R}_{b}^{n})^{\mathsf{T}},$$
(27a)

$$\frac{\partial \mathbf{r}_{Q/O}^i}{\partial \mathbf{\Theta}_b^n} = \frac{\partial \mathbf{r}_{Q/O}^i}{\partial \mathbf{r}_{P/C}^c} \frac{\partial \mathbf{r}_{P/C}^c}{\partial \mathbf{\Theta}_b^n}$$

$$= \frac{\partial \mathbf{r}_{Q/O}^{i}}{\partial \mathbf{r}_{P/C}^{c}} (\mathbf{R}_{c}^{b})^{\mathsf{T}} \left[ \left( \frac{\partial \mathbf{R}_{b}^{n}}{\partial \phi} \right)^{\mathsf{T}} (\mathbf{r}_{P/N}^{n} - \mathbf{r}_{B/N}^{n}) \quad \left( \frac{\partial \mathbf{R}_{b}^{n}}{\partial \theta} \right)^{\mathsf{T}} (\mathbf{r}_{P/N}^{n} - \mathbf{r}_{B/N}^{n}) \quad \left( \frac{\partial \mathbf{R}_{b}^{n}}{\partial \theta} \right)^{\mathsf{T}} (\mathbf{r}_{P/N}^{n} - \mathbf{r}_{B/N}^{n}) \right].$$
(27c)

# Note

When finding the Jacobian of (13) with respect to Euler angles, we must take the Jacobian of the rotation matrix with respect to its parameters. The rotation matrix can be parametrised by Euler angles as follows:

$$\mathbf{R}(\mathbf{\Theta}_b^n) = \mathbf{R}_z(\psi)\mathbf{R}_y(\theta)\mathbf{R}_x(\phi) = e^{\psi \mathbf{S}(\mathbf{e}_3)}e^{\theta \mathbf{S}(\mathbf{e}_2)}e^{\phi \mathbf{S}(\mathbf{e}_1)}.$$

The Jacobians with respect to each Euler angle are given by

$$\frac{\partial \mathbf{R}(\boldsymbol{\Theta}_{b}^{n})}{\partial \psi} = \frac{\partial \mathbf{R}_{z}(\psi)}{\partial \psi} \mathbf{R}_{y}(\theta) \mathbf{R}_{x}(\phi) = \mathbf{S}(\mathbf{e}_{3}) \mathbf{R}_{z}(\psi) \mathbf{R}_{y}(\theta) \mathbf{R}_{x}(\phi) = \mathbf{R}_{z}(\psi) \mathbf{S}(\mathbf{e}_{3}) \mathbf{R}_{y}(\theta) \mathbf{R}_{x}(\phi),$$

$$\frac{\partial \mathbf{R}(\boldsymbol{\Theta}_{b}^{n})}{\partial \theta} = \mathbf{R}_{z}(\psi) \frac{\partial \mathbf{R}_{y}(\theta)}{\partial \theta} \mathbf{R}_{x}(\phi) = \mathbf{R}_{z}(\psi) \mathbf{S}(\mathbf{e}_{2}) \mathbf{R}_{y}(\theta) \mathbf{R}_{x}(\phi) = \mathbf{R}_{z}(\psi) \mathbf{R}_{y}(\theta) \mathbf{S}(\mathbf{e}_{2}) \mathbf{R}_{x}(\phi),$$

$$\frac{\partial \mathbf{R}(\boldsymbol{\Theta}_{b}^{n})}{\partial \phi} = \mathbf{R}_{z}(\psi) \mathbf{R}_{y}(\theta) \frac{\partial \mathbf{R}_{x}(\phi)}{\partial \phi} = \mathbf{R}_{z}(\psi) \mathbf{R}_{y}(\theta) \mathbf{S}(\mathbf{e}_{1}) \mathbf{R}_{x}(\phi) = \mathbf{R}_{z}(\psi) \mathbf{R}_{y}(\theta) \mathbf{R}_{x}(\phi) \mathbf{S}(\mathbf{e}_{1}).$$
